

NOTE: Images MUST come in pairs and share similar names except for the last 5-7 characters.

✓ Practice Input Files

 practice-1

 practice-1 - Copy

 practice-2

 practice-2 - Copy

 practice-3

 practice-3 copy

 practice-4

 practice-4 copy

Windows Operating System

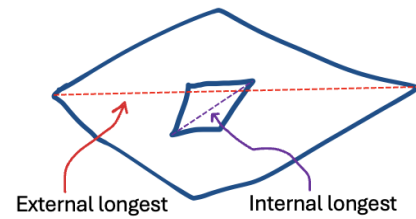

Copy & pasting a file (or many files at the same time) will duplicate it/them, but the duplicated file(s) has the suffix: “ - Copy” at the end of its file name. The script will recognize which one is the copy and which is the original, based on how Windows changes their name by default.

Mac Operating System

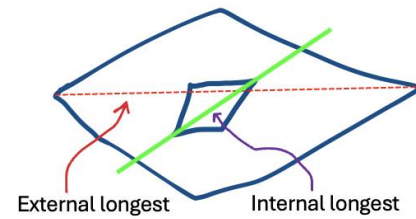

Copy & pasting a file (or many files at the same time) will duplicate it/them, but the duplicated file has the suffix: “ copy” at the end of its file name. The script will recognize which one is the copy and which is the original, based on how MacOS changes their name by default.

Input

practice-1

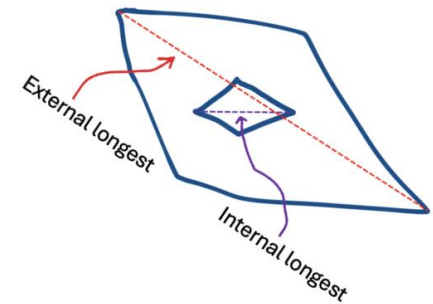

practice-1 - Copy

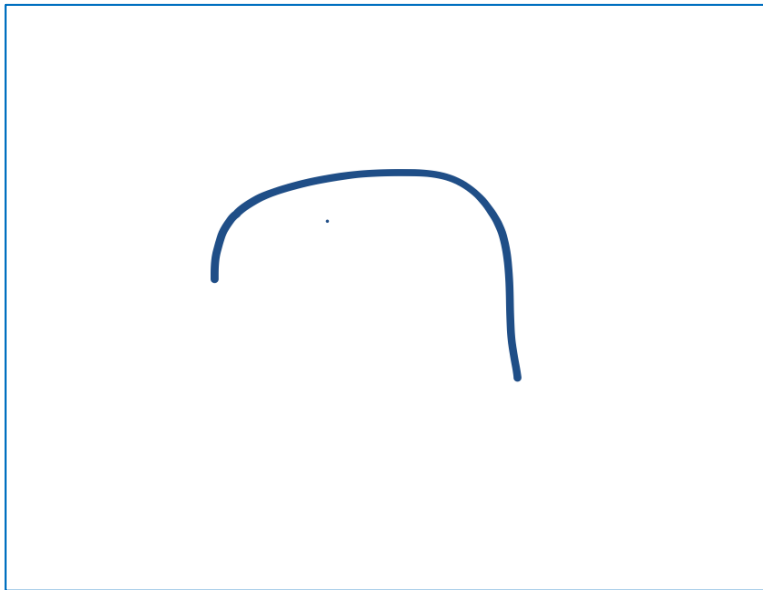

Output

practice-1_rotated

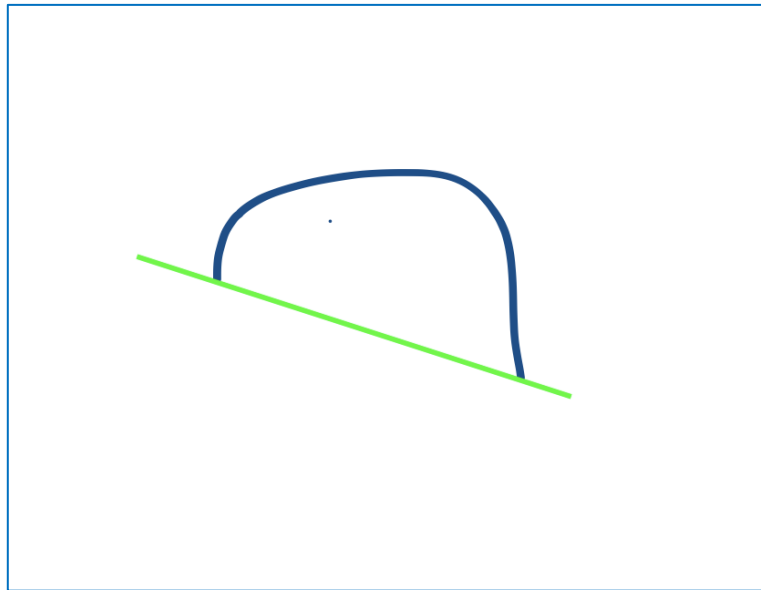

Input

practice-2

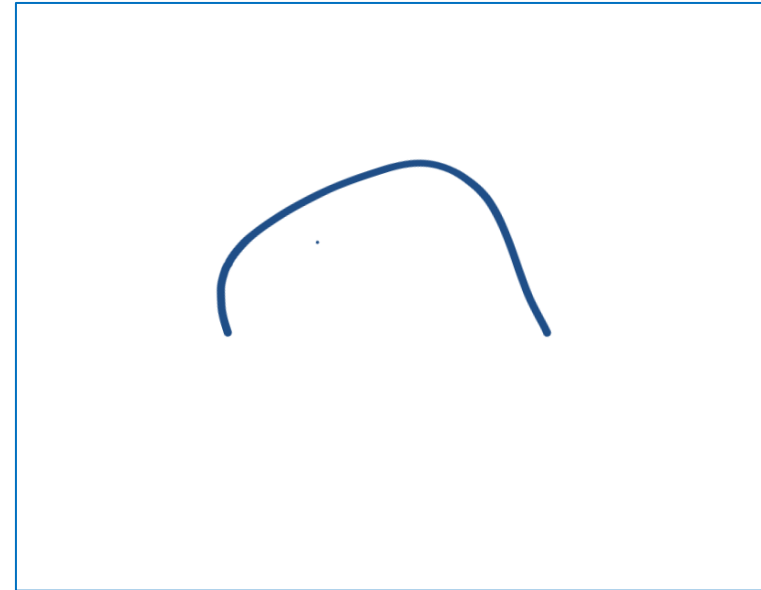

practice-2 - Copy

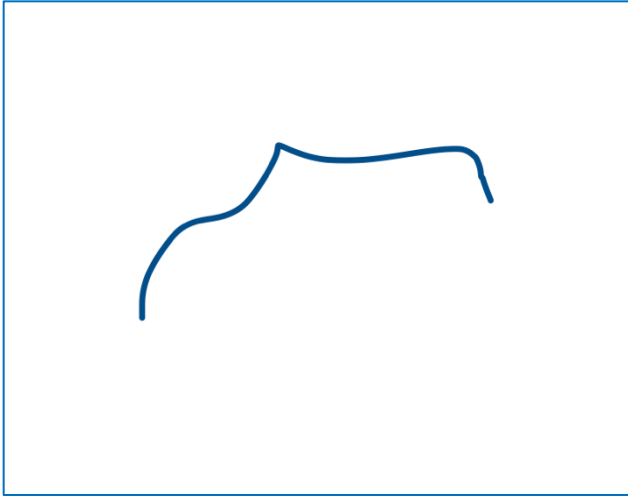

Output

practice-2_rotated

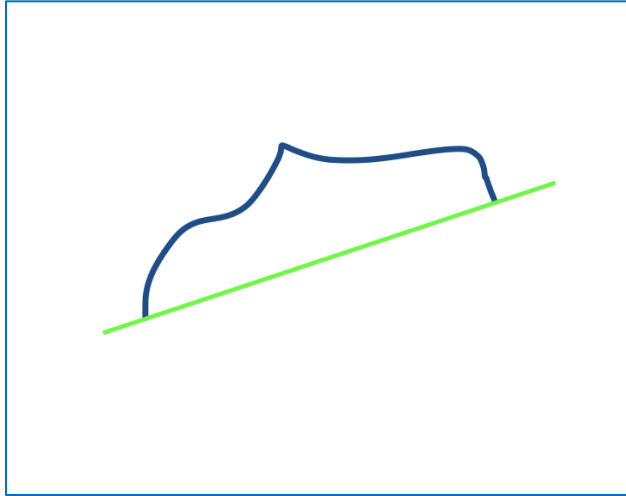

Input

practice-3

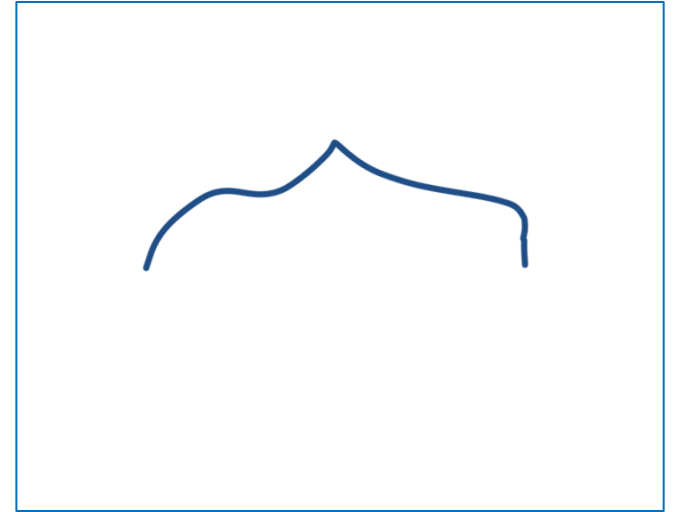

practice-3 copy

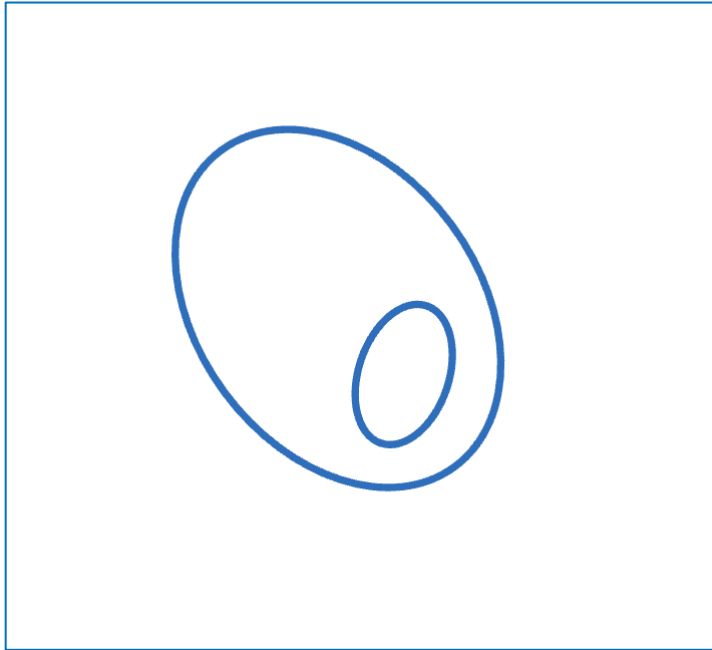

Output

practice-3_rotated

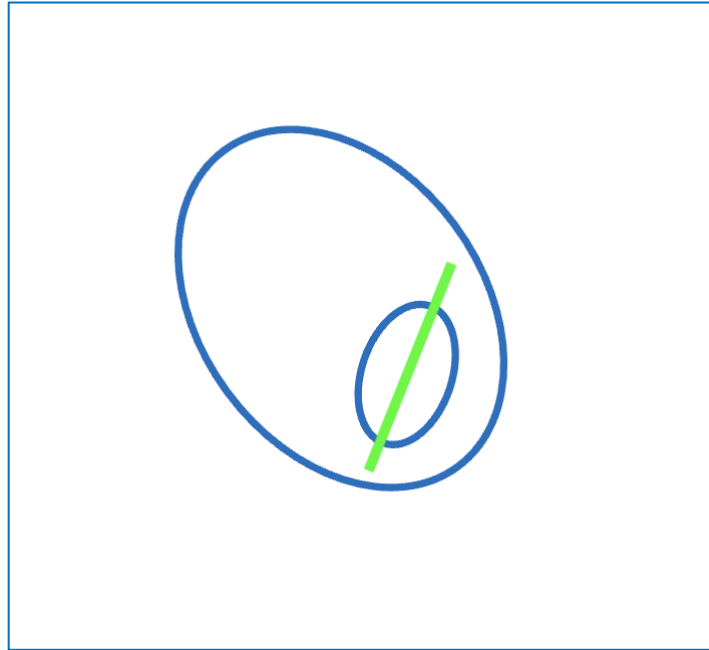

Input

practice-4

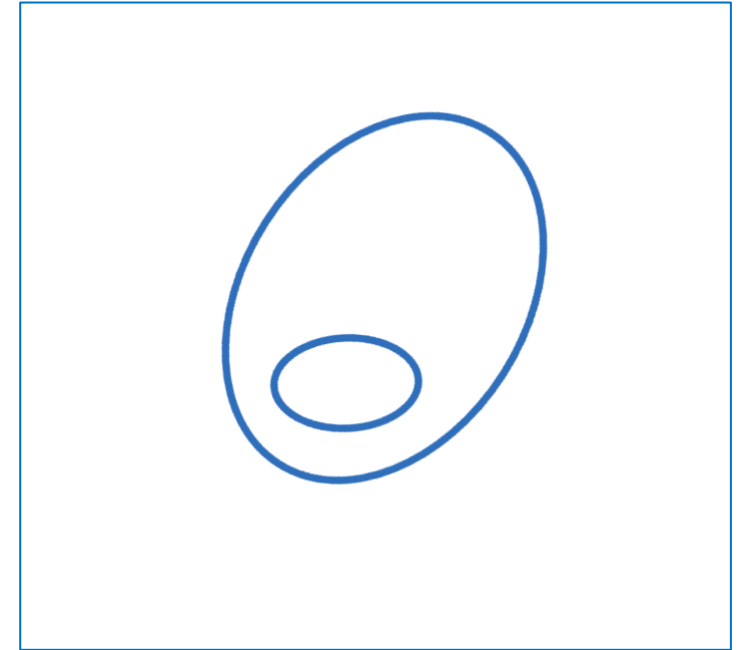

practice-4 copy

Output

practice-4_rotated

Final Notes

1. Make sure the object is **CENTERED** in the middle of the white canvas, or some parts of it will be cut off because of the rotation.
2. Make sure the green line **does NOT touch the edge of the white canvas** or the script won't be able to identify the angle of the green line.
